1 The Foundational Postulates of Mirror Math

1.1 Postulates of the Golden Algebra

- **Definition I (The Core Constants):** The algebraic constants are defined as $T = \frac{\sqrt{5}-1}{4}$, $J = \frac{3-\sqrt{5}}{4}$, and $K = -\frac{\sqrt{5}+1}{4}$.

1.2 Postulates of the Dynamic Framework

- **Postulate I (The Principle of Algebraic Stability):** A system is in a state of stable equilibrium if and only if its Harmonic Center of Gravity, $\Xi = \sum w_i p_i$, is zero.

- **Postulate II (The Principle of Dynamic Resonance):** The interaction between stable systems is governed by a dual-component field:

  1. A static **Harmonic Potential** ($U \propto 1/r^2$), which creates the general force landscape.
  2. A dynamic **Resonant Wobble**, which dictates that stable orbits can only exist at frequencies in harmony with the recurrence relation $p_{n+2} = (2\cos(\pi/5))p_{n+1} - p_n$.

1.3 Postulates of the Riemann Correspondence

- **Postulate III (The Principle of Algebraic Reflection):** For any Zeta zero, s, there exists a corresponding algebraic mirror system where the mirror of $x = \mathrm{Re}(s)$ must obey the Universal Bridge Law.

- **Postulate IV (The Principle of Symmetric Fixation):** For the framework to be universal, it must be based at the invariant fixed point ($k = 1$) of the symmetry group induced by the Zeta function.
